Usability and Accessibility

The website I choose is: https://www.udemy.com/

Assessment Criteria	PASS/FAIL	Screenshoot of Resutl
Website passes the W3S Validator	**Fail**	Website passes the CSS Validator	Pass	
Website status using [Siteimprove]	**Fail**	
To improve the **Udemy** website:

- The first place where I can see that there could be improvement would be to only have one id named as **#icon-wishlisted** they have two of them with the same id and that could create confusion when styling this item and it is recommended that id should be made unique because they overwrite anything you may have done.

- Another problem that I saw was that the line for paragraphs was below the minimum value of 1.5 times the font size. The reason this needs to increase is because it may make it harder for users with low vision or cognitive conditions by making the text harder to read. By increasing the line height you will improve both usability and accessibility to your users.

- Another problem that I saw was that the text is clipped when resized, this would be a problem relating to accessibility if a user needed to increase the zoom of the website so that he may read it better there may be some text get clips because of the overflow: hidden in the css that was added.

- Another issue that I saw in my opinion is that the text is too dark against the all white background. If you spend my time on the website, the contrast and the sharpness of the dark of the text start to irritate or hurt your eyes. One solution for this is to decrease the darkness of the text and make it a little lighter.
